

Wesley Rawstron

“Independent Systems Designer / Tool Builder”

Designs decision-support systems that reduce cognitive load under real-world data constraints.

Experience

- **Independent Systems Design & Research Projects**
Grocery Price & Meal Planning System
(Link prominently to GitHub)

What I've accomplished

- Designed and maintained a multi-year decision-support system focused on reducing cognitive load under inconsistent, real-world data conditions
- Took ownership of full system architecture, including data modeling, normalization assumptions, failure handling, and long-term maintainability
- Prioritized practical correctness and user trust over theoretical perfection, explicitly documenting assumptions and tradeoffs
- Built AI-assisted subsystems for orchestration and pattern adaptation rather than standalone “black box” AI features
- Iteratively adapted system design in response to changing requirements, data sources, and user constraints
- Scoped automation deliberately to preserve user agency, reversibility, and auditability
